Trends in Evaporation Estimates for the Canadian Prairies

Canada

Trends in Evaporation Estimates for the Canadian Prairies

Outline

- Why Conduct the study?
- Methodology for Phase 1 – Is there a Trend?
- Results from Phase 1
- Methodology for Phase 2 – What caused the Trends?
- Results from Phase 2

Trends in Evaporation Estimates for the Canadian Prairies

Meyer formula:

$$EG = CK(V_w - V_a)(1 + 6.2139 \times 10^{-2}W)(1 + 3.28084 \times 10^{-5}A)$$

where: EG = monthly gross evaporation in mm

C = coefficient dependent on how saturated vapour pressure is calculated (10.1 to 11)

K = metric conversion of 0.750062

V_w = saturated vapour pressure (millibars) at surface of water body

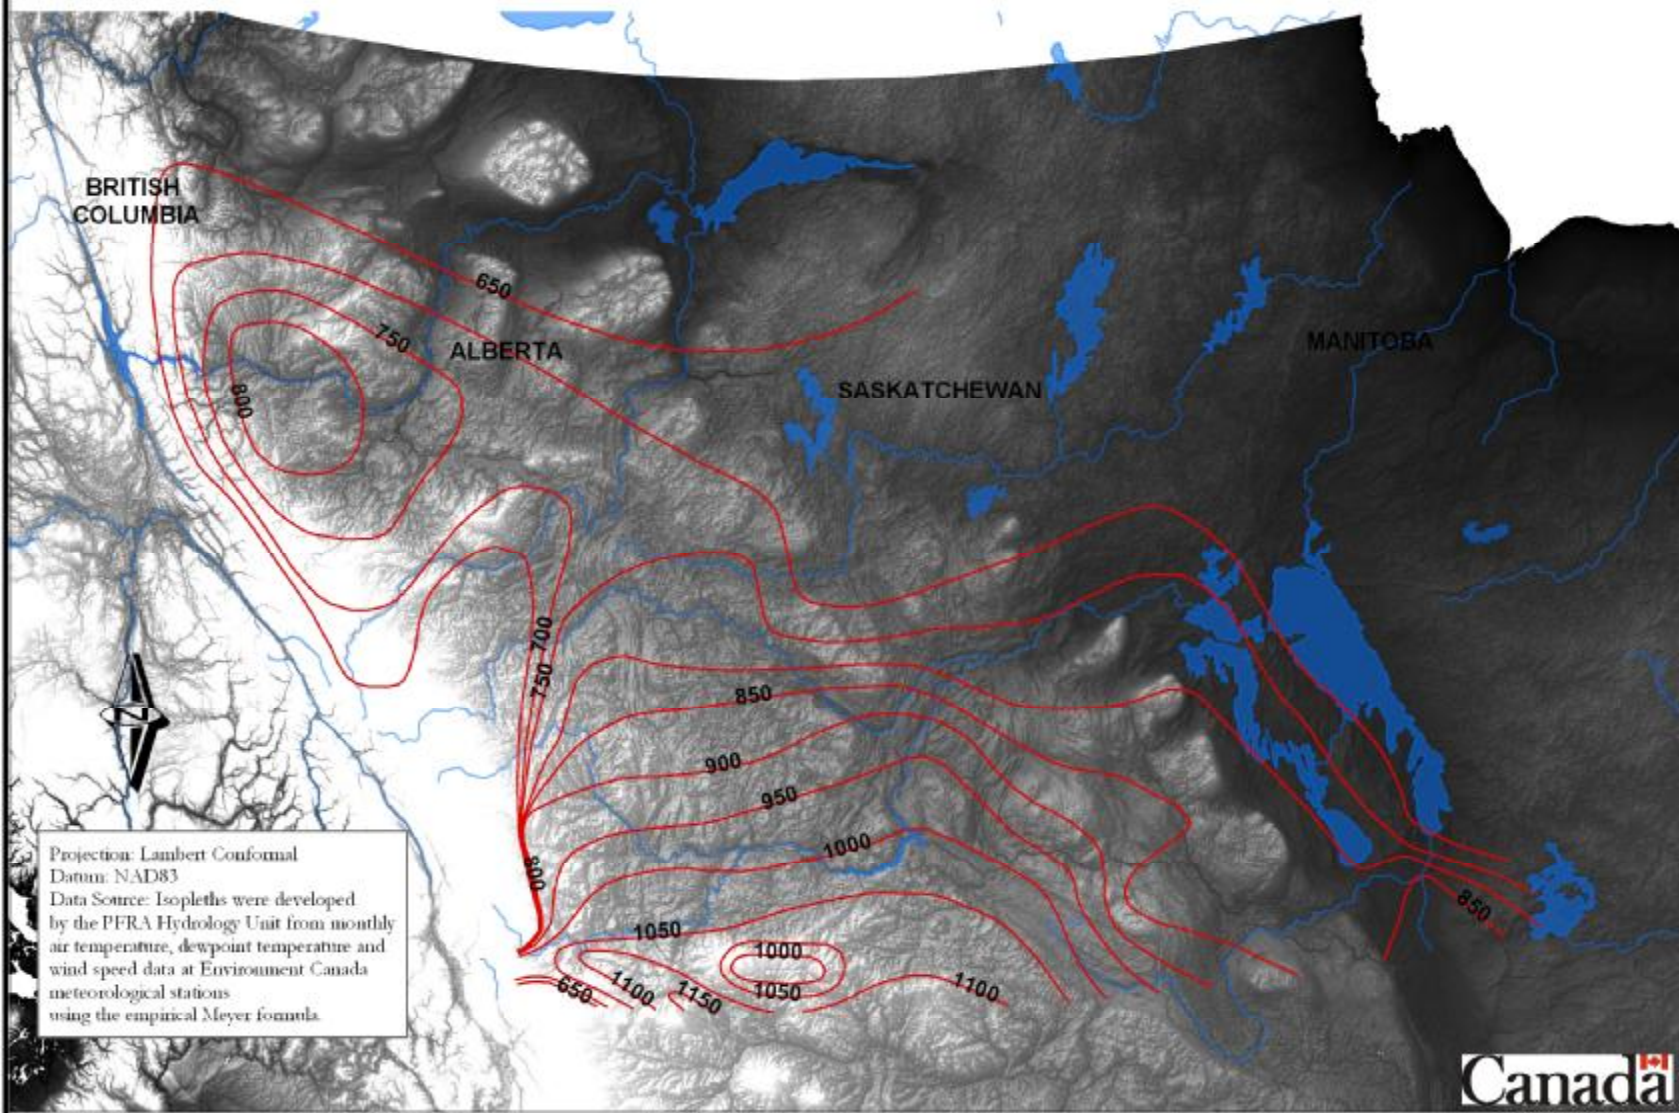

V_a = actual vapour pressure (millibars) at 7.62 metres above ground

W = wind speed (km/hr) at 7.62 metres above ground

A = elevation in metres above sea level

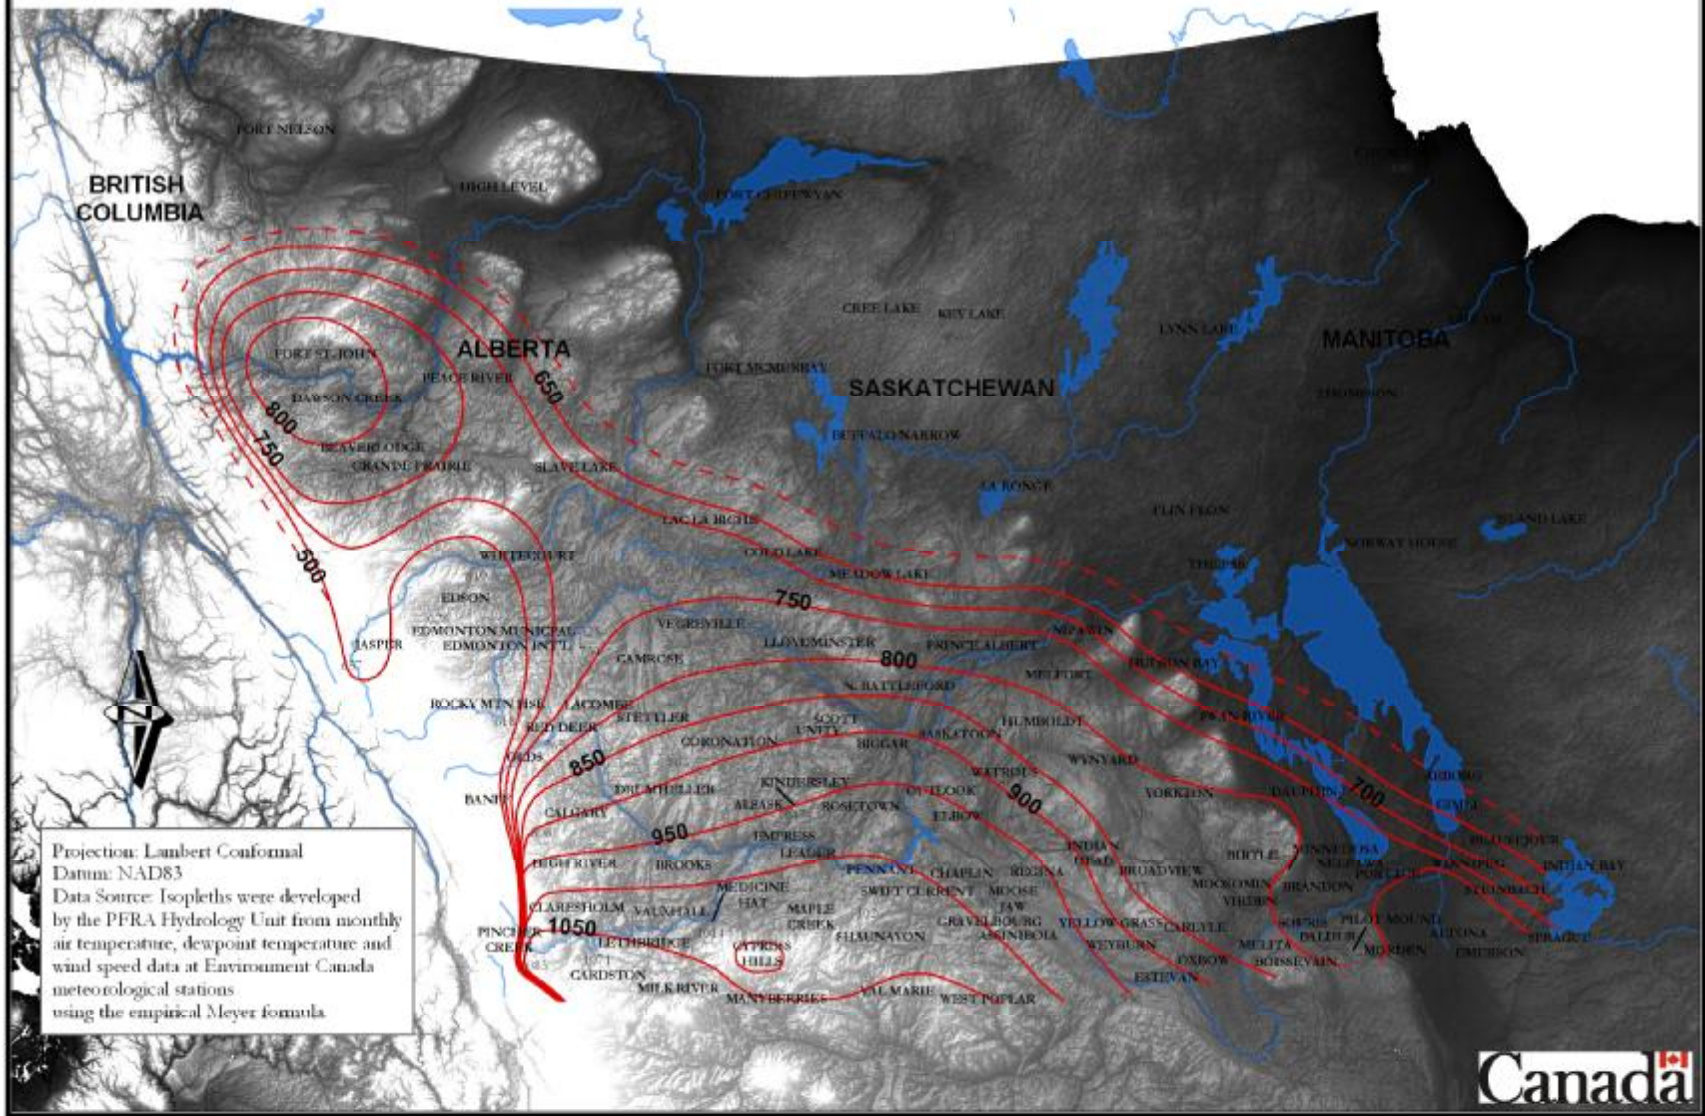

Mean Annual Gross Evaporation (mm) In The Canadian Prairies For The Standard 30 - Year Period 1961-1990

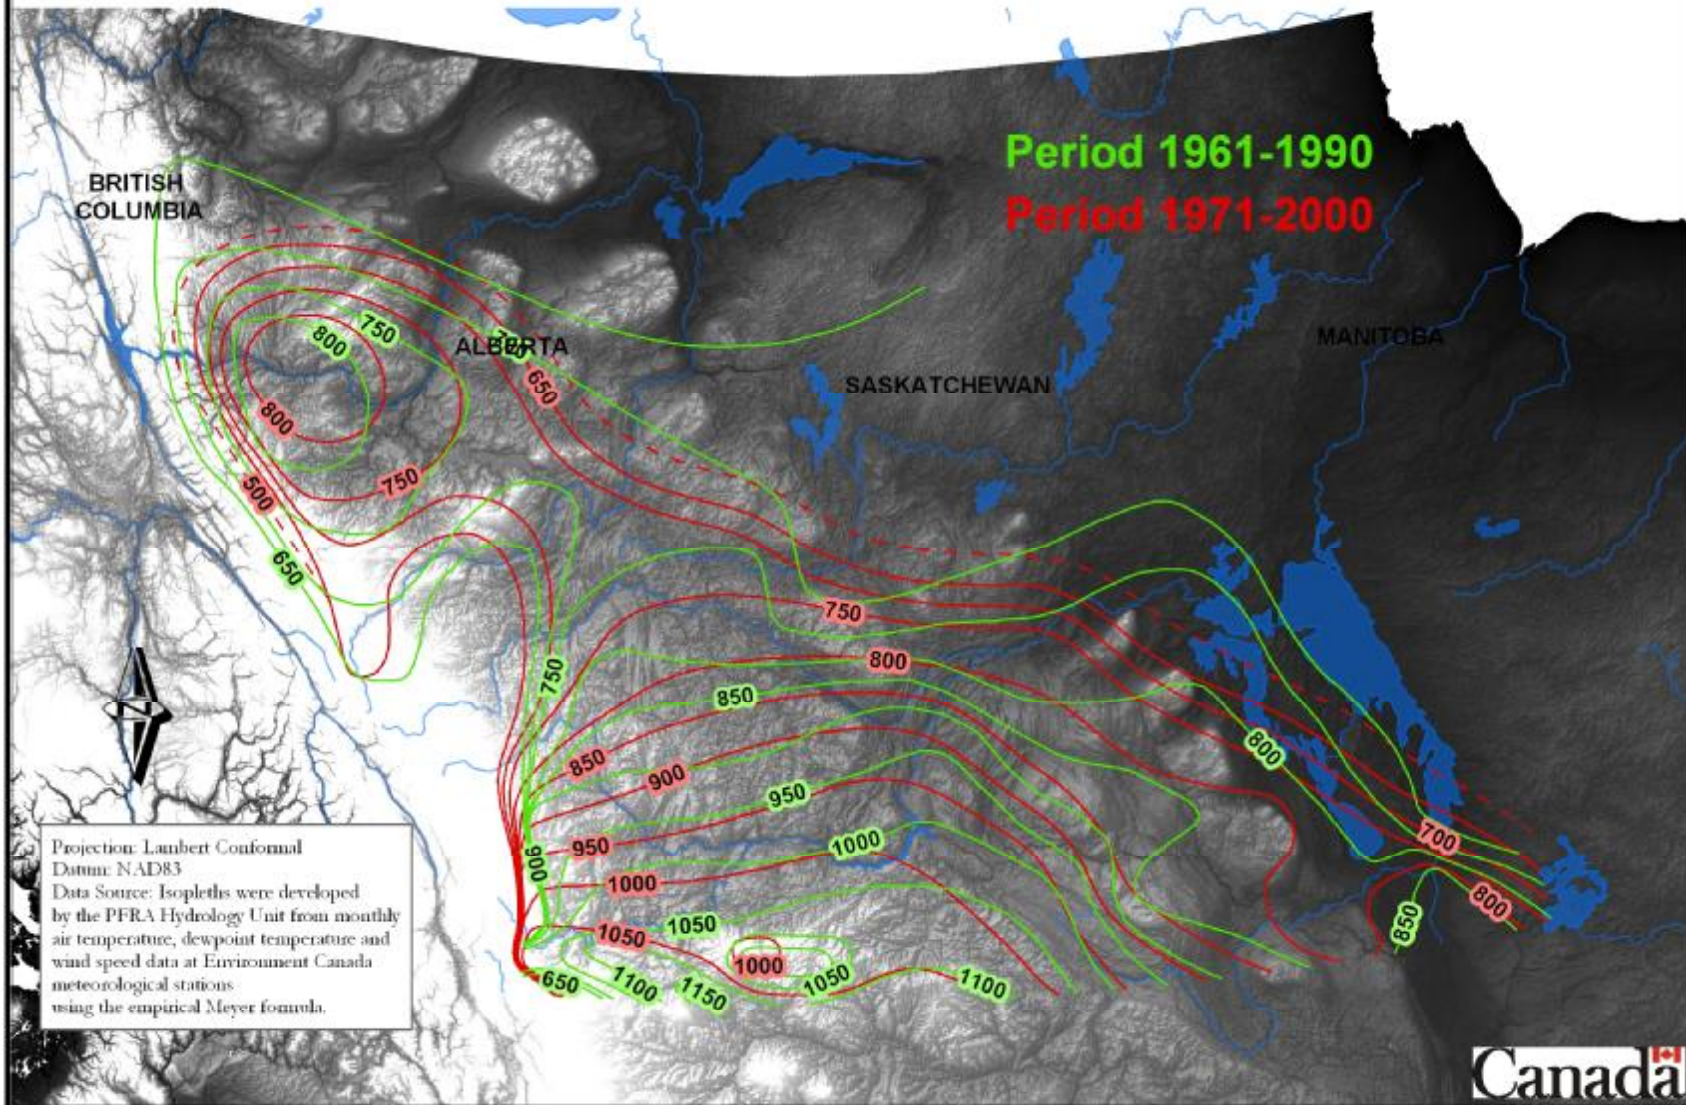

Mean Annual Gross Evaporation (mm) In The Canadian Prairies For The Standard 30 - Year Period 1971-2000

Mean Annual Gross Evaporation (mm) In The Canadian Prairies For Comparison of Period 1961-1990 and 1971-2000

Analysis of Trends in Evaporation – Phase 1

Prepared by:

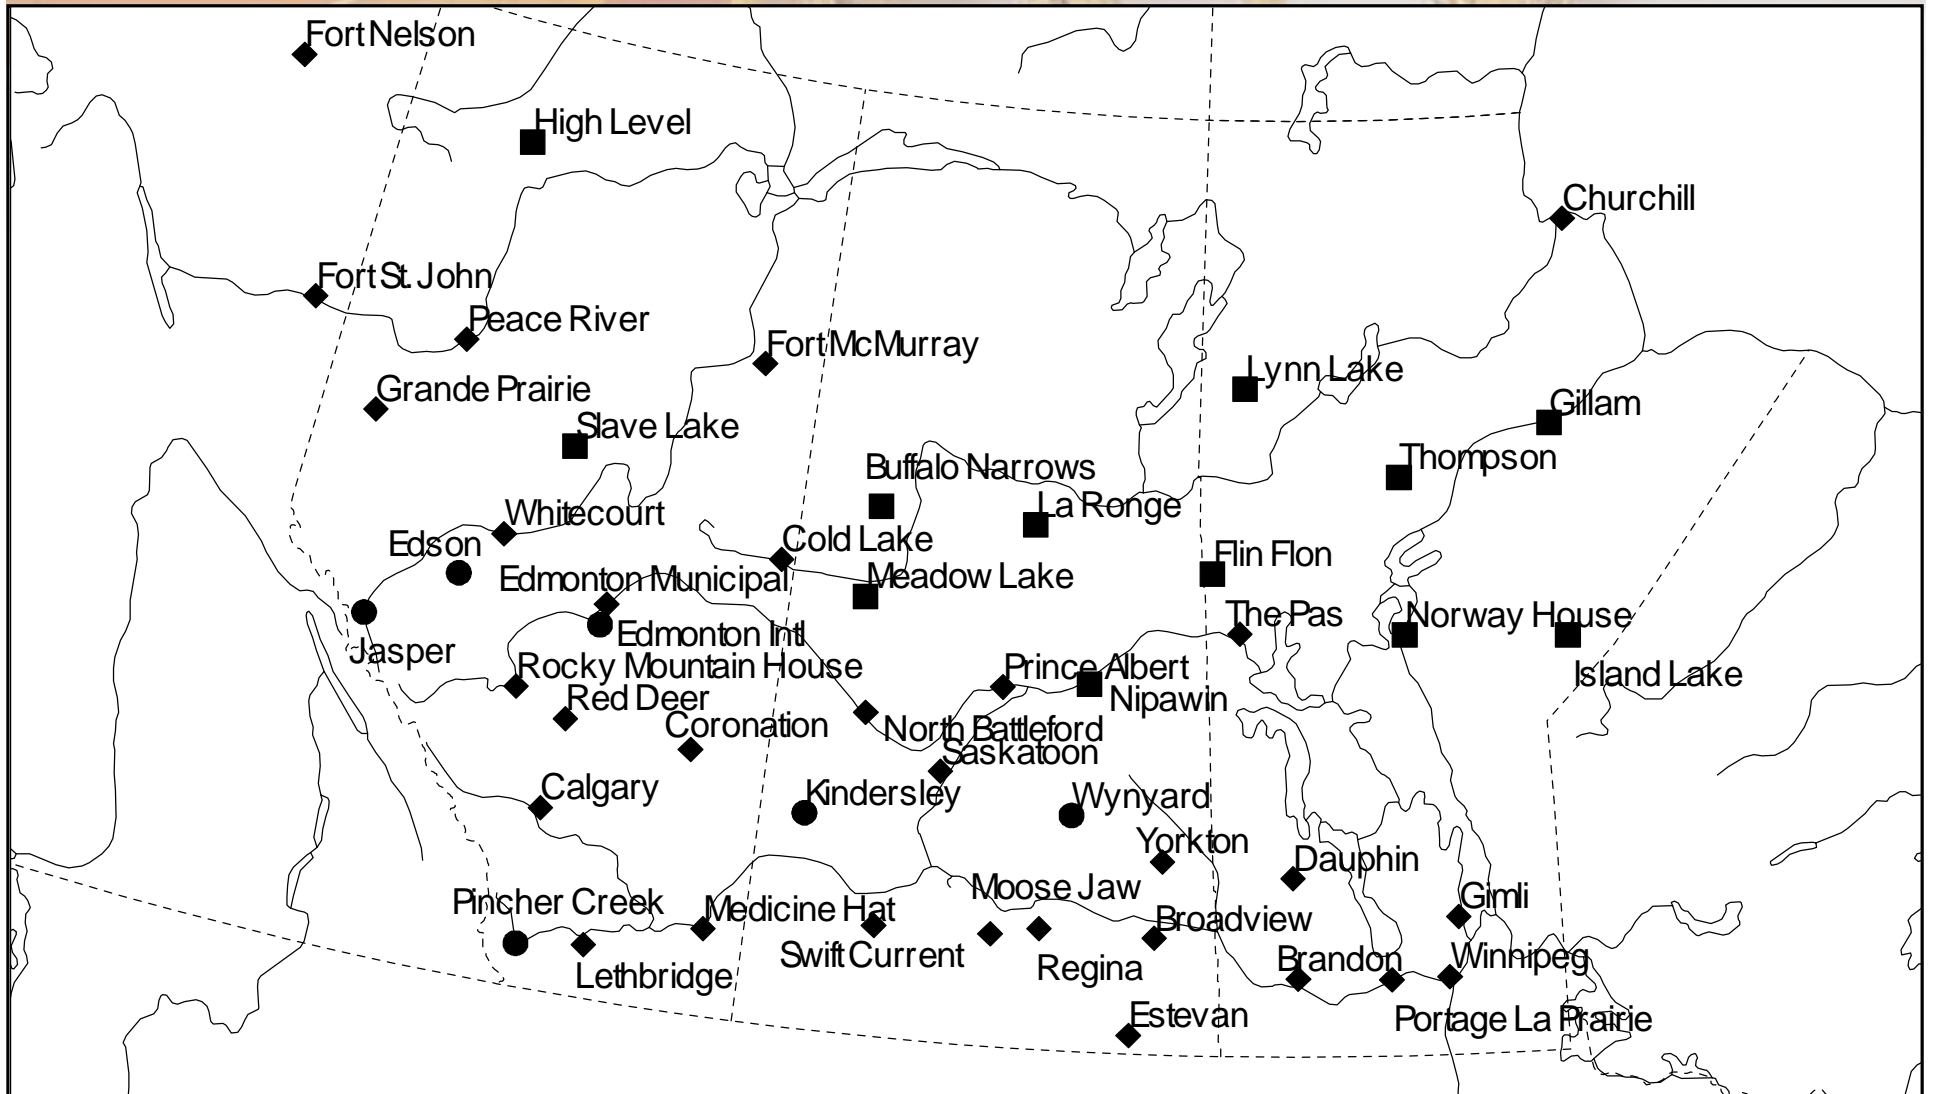

Nicole M. Hesch and Donald H. Burn, Ph.D. P.Eng.

Department of Civil Engineering, University of Waterloo

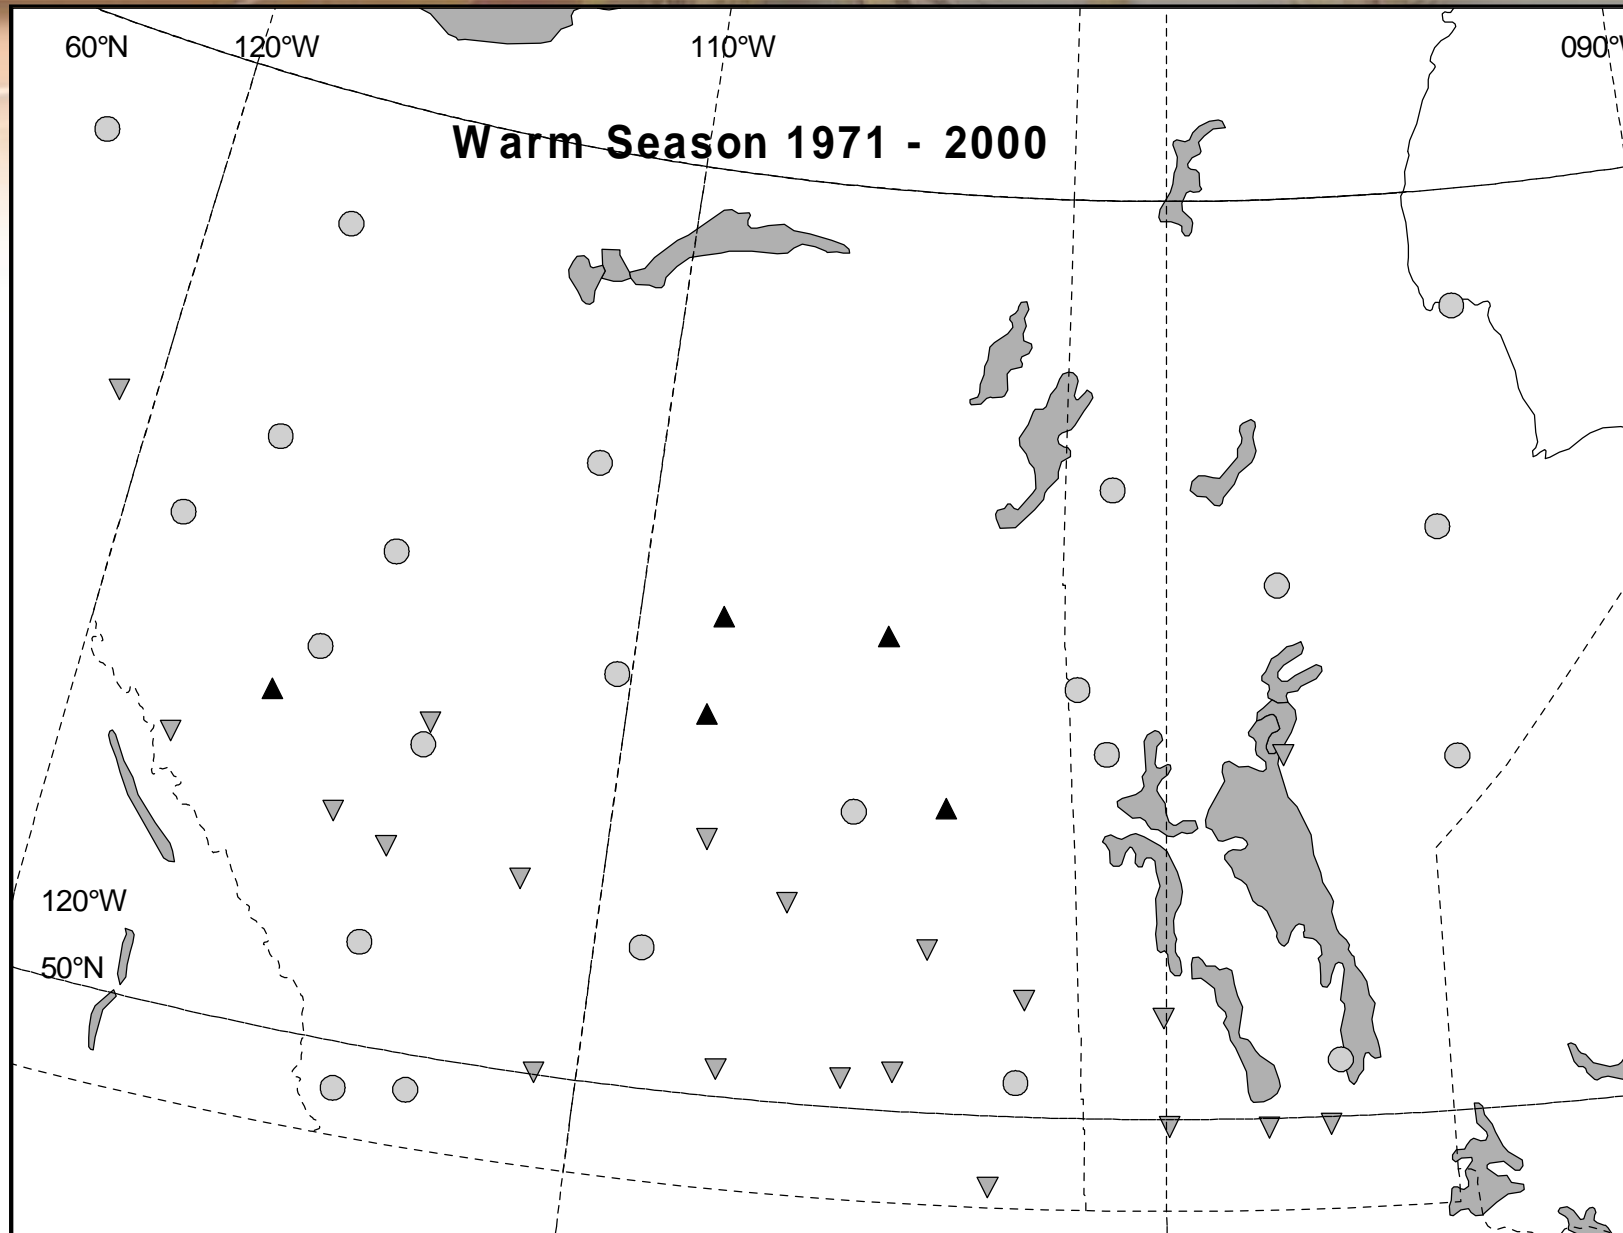

Submitted to Agriculture and Agri-Food Canada – PFRA – May 2005

- Three time periods – 1951-2000, 1961-2000 and 1971-2000
- Significant trends identified using Mann-Kendall statistical test for trend and bootstrapping resampling.
- Comparisons made between gross evaporation and pan evaporation trends

Box and Whisker plots of monthly trend slope values for the 40-year period 1961-2000

Box and Whisker plots of warm season trend slope values for the periods

Analysis of Trends in Evaporation – Phase 2

Prepared by:

Nicole M. Hesch and Donald H. Burn, Ph.D. P.Eng.

Department of Civil Engineering, University of Waterloo

Submitted to Agriculture and Agri-Food Canada – PFRA –
January 2006

- Three time periods – 1951-2000, 1961-2000 and 1971-2000
- Explores gross and pan evaporation trends by examining the origins.
- Examined control mechanisms: air temperature, wind speed, dew point temperature, water vapour pressure (V_w) air vapour pressure (V_a) and $V_w - V_a$ (vapour pressure deficit)

Analysis of Trends in Evaporation – Phase 2

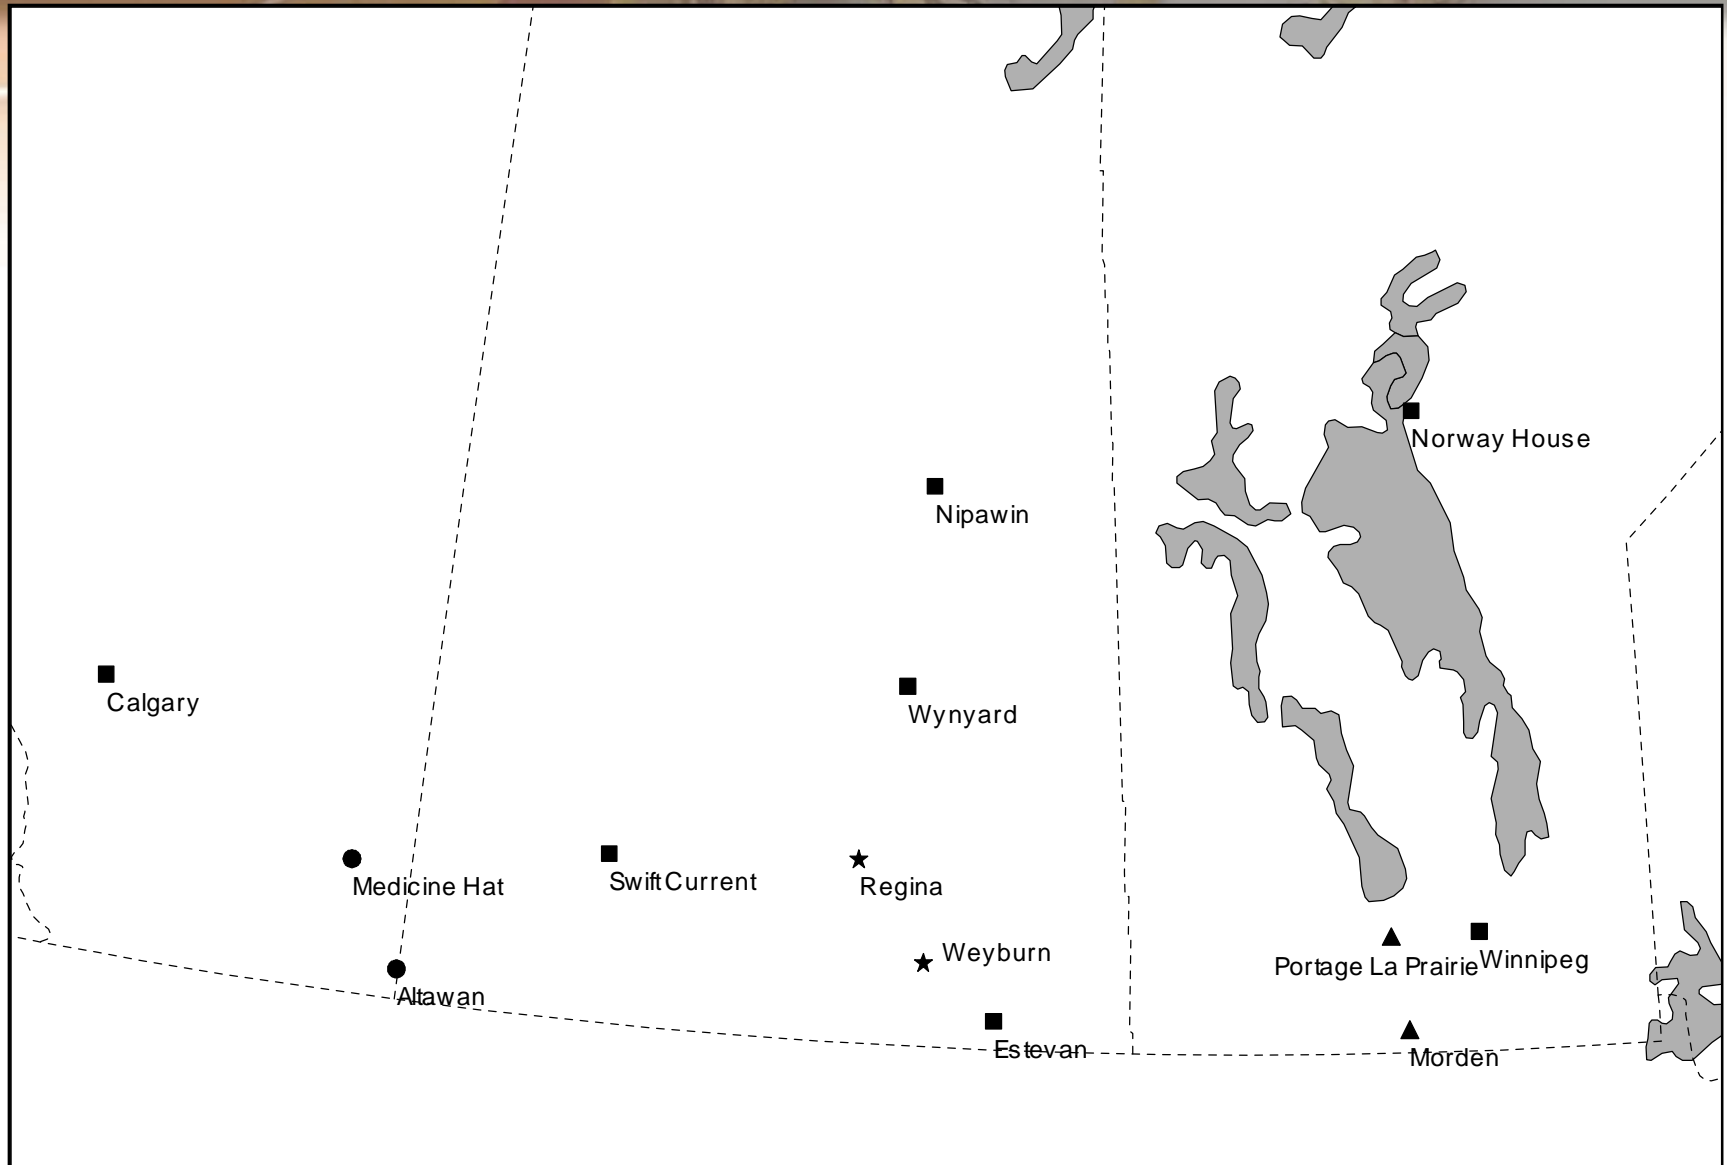

Results:

- Wind speed showed field significant trends for all 3 time periods
- Causal mechanisms for gross evaporation were wind speed or $V_w - V_a$
- Wind speed generally more influence for decreasing trends
- $V_w - V_a$ generally more influence for increasing trends
- Causal mechanism for pan evaporation was $V_w - V_a$
- Wind speed exerted influence on gross evaporation and not pan evaporation.
