

The CLASS Lake Module

Murray D. MacKay
Environment Canada

Last year ...

Lake Råksjön
April 28 – May 12 1995

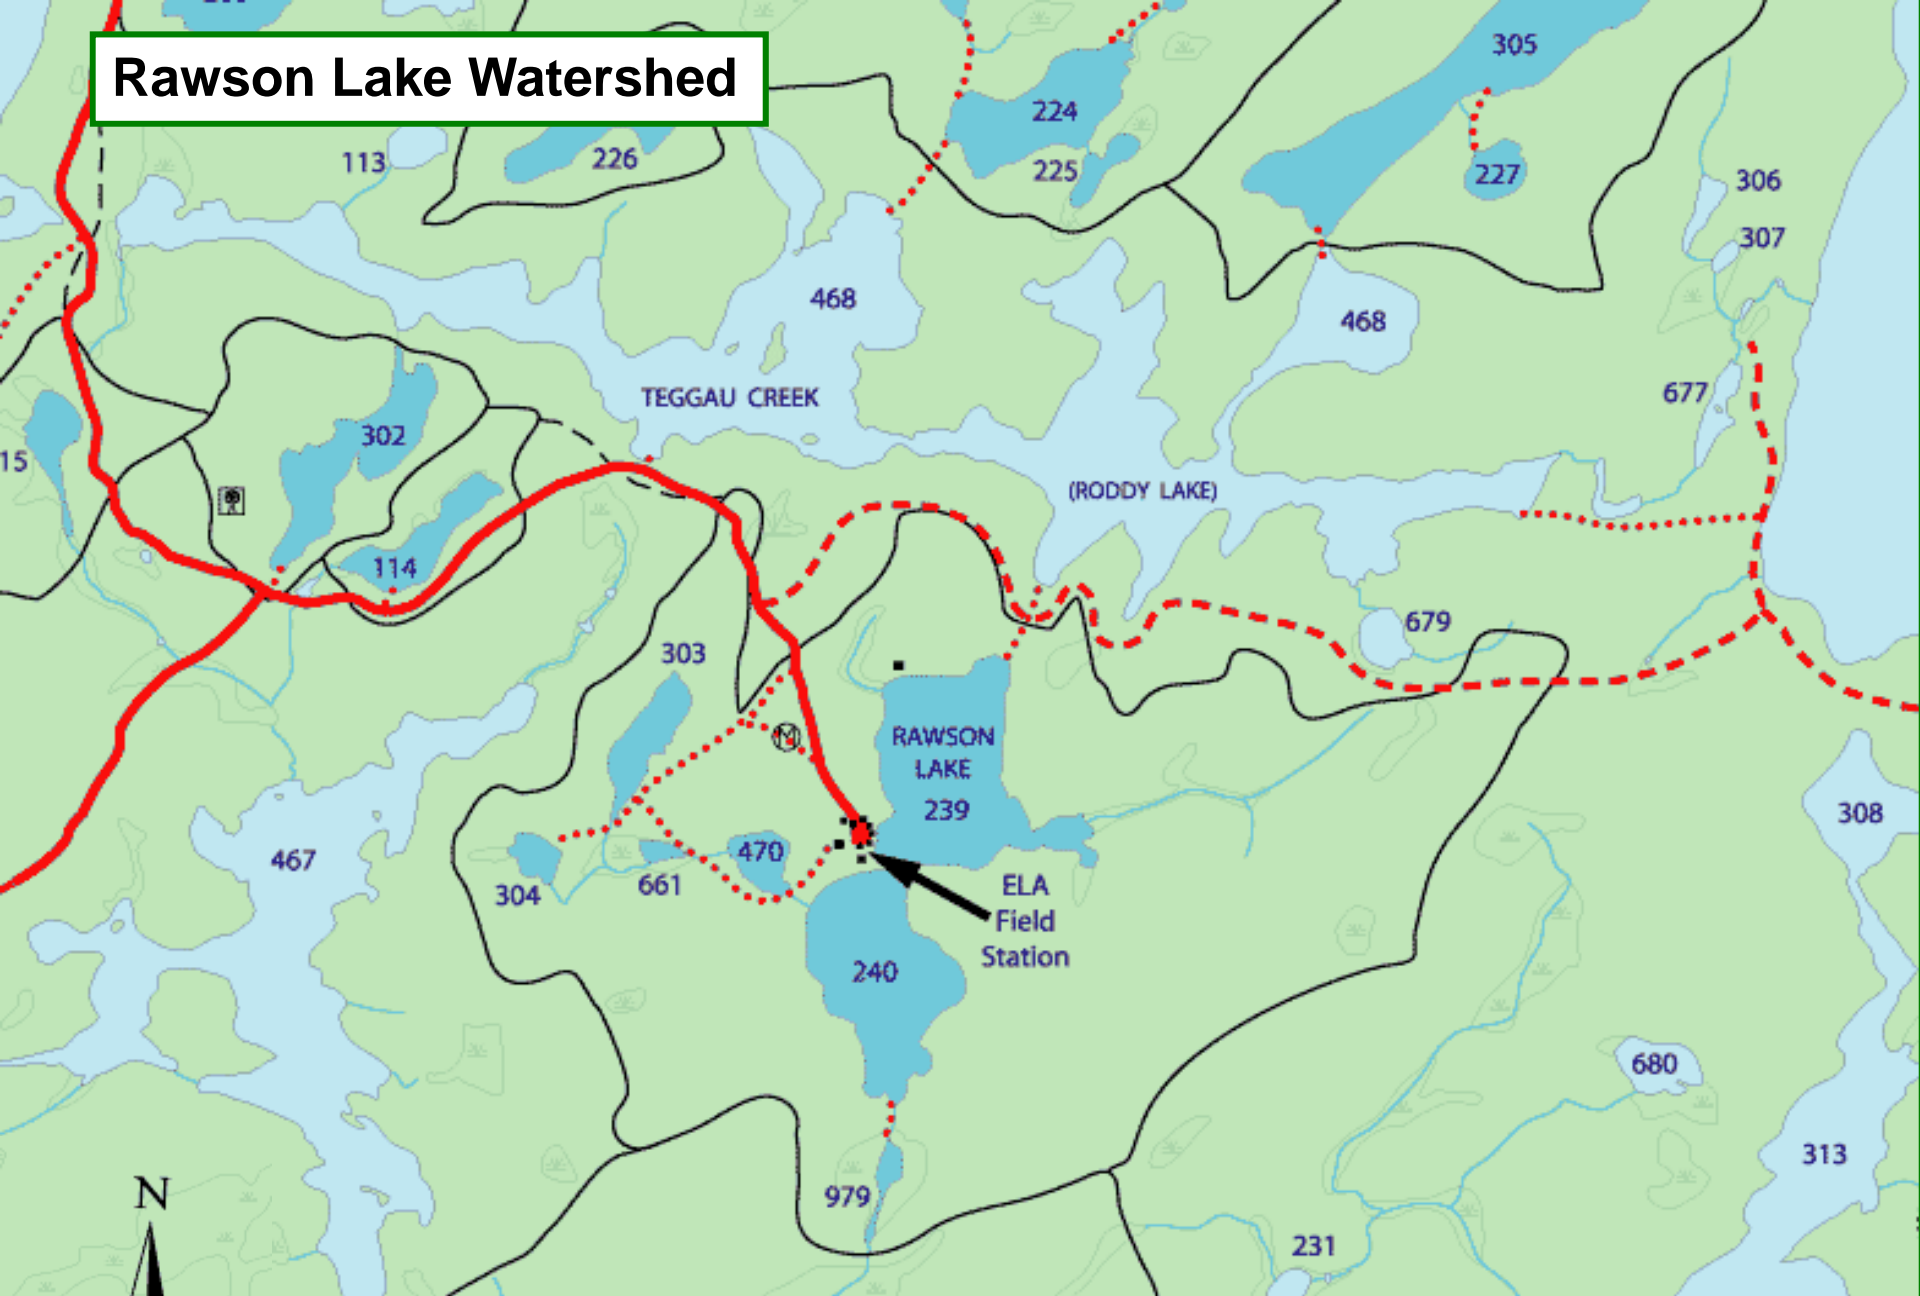

... not enough data to understand problems

Experimental Lakes Area

Rawson Lake Watershed

CLASS Lake Module

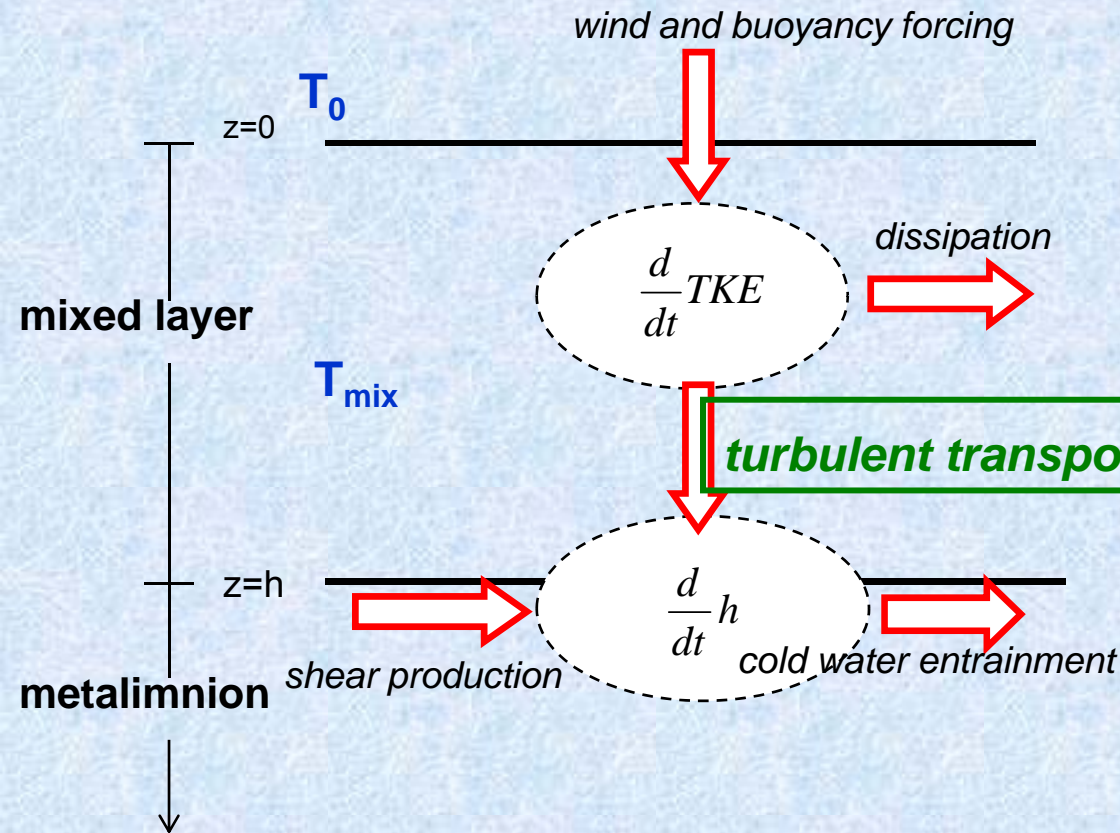

- thermal model computes surface energy balance and light attenuation through column

CLASS Lake Module

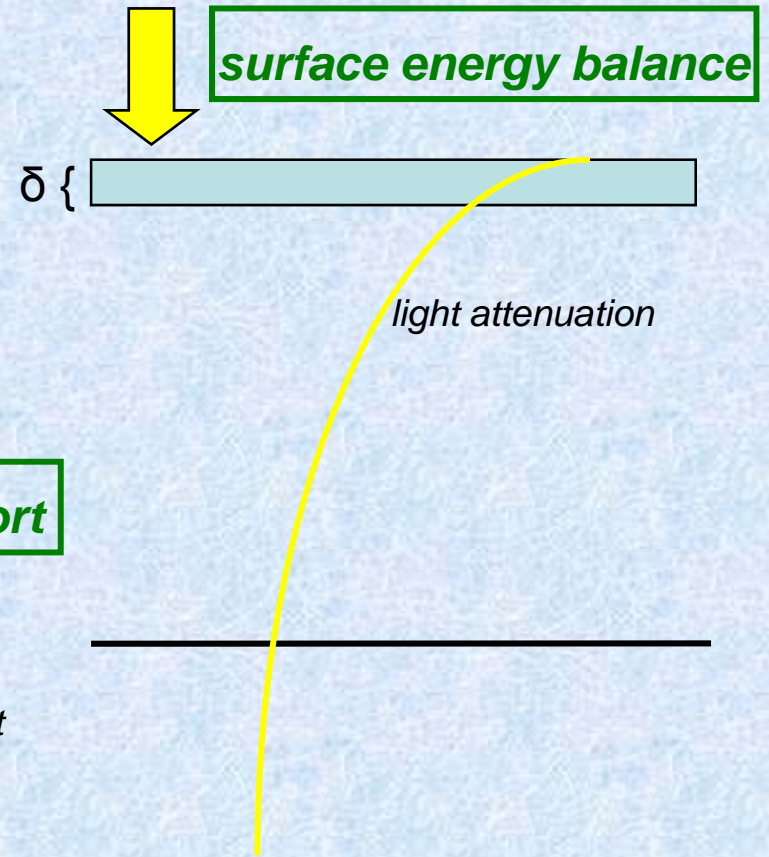

- well know sources/sinks of *turbulent kinetic energy* govern depth of mixed layer
- both surface energy balance and mixed layer depth affect surface temperature

CLASS Lake Module

Transport of TKE to thermocline
less efficient than expected

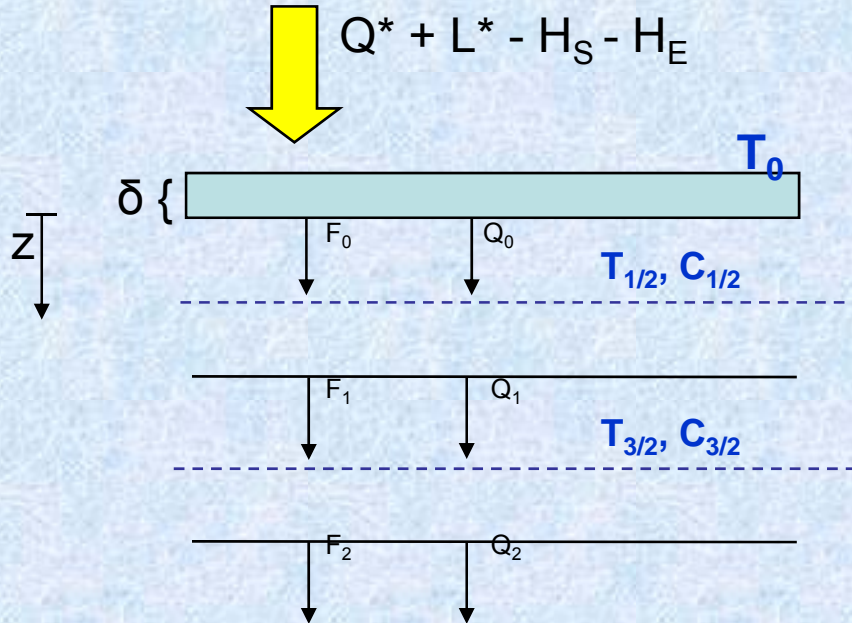

Turbulence Model

Surface energy balance
generalized

Thermal Model

Generalized Surface Energy Balance

$$\frac{\partial T}{\partial t} = - \left(\frac{1}{\rho c_w} \right) \frac{\partial F}{\partial z} - \left(\frac{1}{\rho c_w} \right) \frac{\partial Q}{\partial z}$$

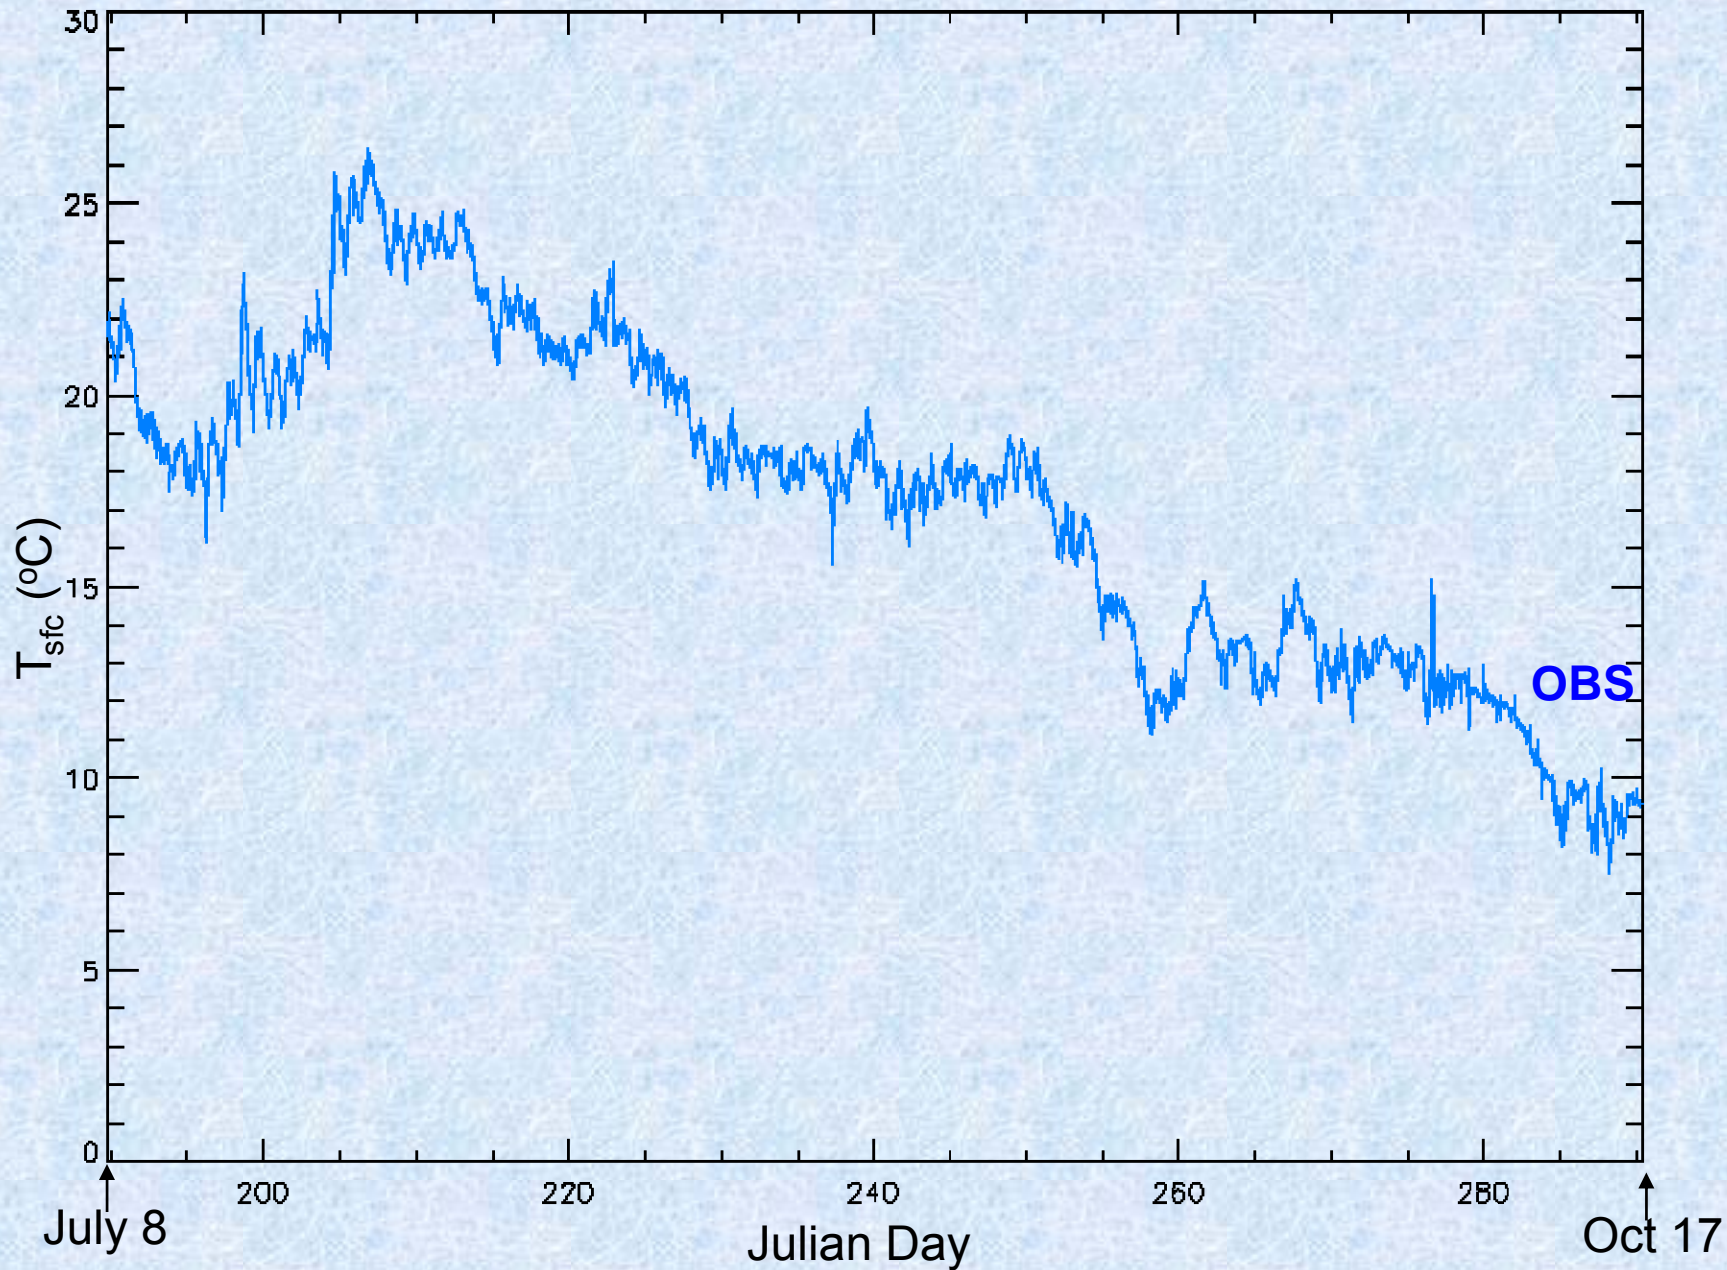

$$F(z) = -K \frac{\partial T}{\partial z}$$

$$Q(z) = Q^* \left\{ \sum_{i=1}^3 a_i \exp(-b_i z) \right\}$$

$$\frac{\partial F_0}{\partial t} = - \left[\left(\frac{1}{\rho \delta c_w} \right) \frac{\partial}{\partial z} \left[F_0 - \left(\frac{L^* - H_S}{\rho c_w} \right) \frac{\partial Q}{\partial z} - H_E \right] + Q_0 - Q^* \right]$$

SUMMARY

- Surface layer simulations much more realistic but:
 - still problems at thermocline
 - don't know yet if lake overturn and ice formation will be well simulated

Ongoing Work:

- turbulent flux to atmosphere assumes neutral drag coefficient
- light extinction coefficients estimated (but data exist)
